

1. Medical Image Enhancement.
 1. Power law (Gamma) transformation $\gamma < 1$
2.
 - * In darker dark regions without significant affecting bright regions
 - * It improves the visibility of soft tissues in the X-ray
2.
 - * Dark tissues become brighter
 - * Hidden details become visible
 - * Bones structure remain clear while overall image contrast improves

2. City time surveillance

1. Which transformation would improve
Log transformation

2. Log transformation expands low intensity pixel value and bright, dark image

3. *
- * The Parking lot becomes brighter
 - * vehicles and people become clearer
 - * more details are visible.

3.

1. contrast stretching (gray level contrast enhancement)

2. * increases the contrast between fingerprint ridges

* Low intensity areas are enhanced

3. * The overall image becomes brighter

* Ridge contrast may not improve

Sufficiency
